Genomics II Mar 11 2022 Genomics is the study of the genomes of organisms. The field includes intensive efforts to determine the entire DNA sequence of organisms and fine-scale genetic mapping efforts. It is a discipline in genetics that applies recombinant DNA, DNA sequencing methods, and bioinformatics to sequence, assemble, and analyze the function and structure of genomes. Genomics II - Bacteria, Viruses and Metabolic Pathways is the second volume of our Genomics series. There are totally three volumes in this series. Chapter 1 describes an analysis and statistical scoring approach for cellular assay data based on single-cell information. In Chapter 2, the concept of metabolic pathways analysis is introduced. The mathematic principle of extreme pathway and elementary flux mode are compared. Chapter 3 is dedicated to the Pathway- and Network-based analysis of the high-throughput genomic data. The author introduced Reactome FI Cytoscape plugin that can construct a network based on the list of genes of interest, cluster the constructed network, and

annotate network modules based on pathways and Gene Ontology terms. Chapter 4 provides a review of microarray and RNA-seq techniques for high-throughput gene expression measurements, discusses the strategies and issues of high-level analysis on gene expression data, and introduces a new algorithm for analyzing microarray data. Chapter 5 summarizes our current understanding of the intracellular defenses by APOBEC family against invading nucleic acids including endogenous retroelements that make up more than 40% of the mammalian genome. Chapter 6 discusses immunoinformatics software that can be employed to study the evolution of antigenic epitopes. Chapter 7 discusses the integration of retroviral genome into host DNA, which is a critical step in the life cycle of a retrovirus. The authors developed an assay using some target DNA sequences from common MLV integration sites in the genome of murine lymphomas and an HIV-1 integration site in the genome of T cell integrated into the target DNA in vitro. Chapter 8 discusses how microarray can be as a promising new technology for broad-spectrum pathogen detection, making it possible to test for the presence of thousands of viruses simultaneously. Chapter 9 discusses the origin of the unilateral aminoacylation specificity based on mt SerRS as a typical example. Mitochondrial (mt) aminoacyl-tRNA synthetases (aaRSs) are able to charge both mt and bacterial cognate tRNAs, whereas most bacterial synthetases including serine (Ser) are only able to charge bacterial cognate tRNAs, whose phenomenon is termed unilateral aminoacylation specificity between mitochondria and bacteria. In Chapter 10, the authors chosen Cytoplasmic polyhedrosis virus (CPV) and hepatitis B virus (HBV) to demonstrate how we can using structural biology techniques to explore the viral genome, such as genome package and distribution, and mRNA transcribing/capping/releasing of viruses. Chapter 11 provides an overview of the steps required to correctly perform the genotypic resistance test; a detailed description of computational programs used for the interpretation of this assay is reported. Chapter 12 discusses Influenza C virus, which is a member of the Orthomyxoviridae, a family comprising viruses with segmented single-stranded RNA genomes of

negative polarity. Chapter 13 provides comprehensive essential genes of *Streptococcus sanguinis* and compares them among streptococcal species. A model has been created to predict essential genes in bacteria. Chapter 14 discusses *Lactobacillus casei* Zhang, which was a new probiotic bacterium isolated from traditional home-made koumiss in Inner Mongolia of China. Chapter 15 discusses how the association of comparative genome analysis and protein structure prediction methods could help in high-throughput genome analysis aiming the structure-based rational drug design.

The Prokaryotes Jul 23 2020 The purpose of this brief Foreword is to make you, the reader, hungry for the scientific feast that follows. These two volumes on the prokaryotes offer a truly unique scientific menu—a comprehensive assembly of articles, exhibiting the biochemical depth and remarkable physiological and morphological diversity of prokaryote life. The size of the volumes might initially discourage the unprepared mind from being attracted to the study of prokaryote life, for this landmark assemblage thoroughly documents the wealth of present knowledge. But in confronting the reader with the state of the art, the Handbook also defines where new work needs to be done on well-studied bacteria as well as on unusual or poorly studied organisms. There are basically two ways of doing research with microbes. A classical approach is first to define the phenomenon to be studied and then to select the organism accordingly. Another way is to choose a specific organism and go where it leads. The pursuit of an unusual microbe brings out the latent hunter in all of us. The intellectual challenges of the chase frequently test our ingenuity to the limit. Sometimes the quarry repeatedly escapes, but the final capture is indeed a wonderful experience. For many of us, these simple rewards are sufficiently gratifying so that we have chosen to spend our scientific lives studying these unusual creatures.

Opto-fluidic Manipulation of Microparticles and Related Applications
Dec 16 2019 Abstract
Contemporary biomedical technologies introduce many new instruments that are important for diagnosis and treatment of the patients. Instrument that can do rapid detection of bacterial infections, and further direct medical practitioner to prescribe optimal antibiotics is highly desirable. But unfortunately, this instrument is not available yet. Ideally, this instrument has to be portable to be used at point-of-care. This means it has to be small and inexpensive, but still highly accurate. Another critical requirement for the instrument is that the test results have to be available promptly. Because in case of such complications of bacterial infections as sepsis, each additional hour needed for the test decreases patient's chance of survival. Traditional treatment of bacterial infections is relied on empirical prescription of antibiotics. This kind of treatment is very imprecise and may incur side effects in long term. Meanwhile, optimal prescription of antibiotics for treating bacterial infection relies on the body

fluids tests of patient. Whereas the test often includes bacteriaculture followed by antibiotic susceptibility testing. These steps are very time-consuming and as a consequence, which may cause a negative impact on patient ' s chance of survival. The goal of this project is to address the fundamental challenges of optimal antibiotic prescription and develop new instrument for rapid concentration and analysis of bacteria. This dissertation introduces an innovative approach to bacterial analysis based on a new Opto-Fluidic Manipulation (OFM) technology that we proposed and published in several reputable journals. OFM can be integrated with microfluidics for careful and gentle manipulation of microviii and nano-scale objects in miniature fluid samples. We designed and optimized special bi-layer metallic substrates that can efficiently absorb laser light, locally heat fluids for couple of degrees and generate microscopic currents. These micro-currents can be used to concentrate and project particles, sort them based on their size, capture bacteria, and many other interesting applications. We demonstrated that OFM does not damage live cells, bacteria, and it can be used to carefully isolate desired type of the bacterial cells from fluid samples for further analysis. In addition to that, we showed that isolated live bacteria can be used for rapid antibiotic susceptibility testing. This way we can potentially isolate bacteria from a biological sample and identify the optimal antibiotic under one hour, in comparison with the traditional approaches that can often take from 24 to 72 hours. There are seven chapters in this dissertation. Briefly, chapter one and two explain the mechanism of OFM and optimization process of the integrated chip fabrication. Chapters three, four and five present a system derives from a combination of Opto-Fluidic chip and auxiliary components and various tests of the system with different types of particles. Chapter six demonstrates our latest results on micro-mixing application of OFM that can be used for accelerated antigen-antibody-based sensing. Finally, there are several other projects that I have participated in during Ph.D. study. I briefly discuss my contribution to each project focusing on development of different biomedical devices. Future development of these biomedical instruments might enable many important

applications for better, more affordable, and precise healthcare.

Microbes in Time May 01 2021 It is widely theorized that population and community processes such as competition, predation, and dispersal influence rates of resource flux within ecosystems. Likewise, the properties of an ecosystem, such as resource availability and space, can feed back onto populations and communities, driving their dynamics and evolutionary trajectories. However, empirical research connecting community and ecosystem-level processes remains a critical missing link between these two disciplines. My dissertation attempts to resolve some of these deficiencies by capitalizing on the tractability and replicability of experimental and natural microbial communities. I use these systems to test a number of theories of community-ecosystem feedbacks. In chapter 1, I test the theory that a bioregion's time-integrated area and productivity positively drive the extent of diversification in a radiating lineage. This theory of time-integration was developed in response to mismatches in the taxonomic diversity observed in a region (e.g., an island) compared to values predicted from species-area or species-productivity relationships. Time-integration implies that if a region's historical area and productivity were higher than they are today, then its unexpectedly large biodiversity (for its contemporary area and/or productivity) might be explained by historical conditions favoring radiation and a persistence of many or all of these clades as area and/or productivity decreased. To test this theory, I used the bacterium *Pseudomonas fluorescens* SBW25 -- a model system for adaptive radiation. I set up independent replicate microcosms that were randomly assigned to different volumes and productivities and transferred every few days so as to experience different environmental histories. By tracking these diversifying communities over time, I demonstrate that time-integrated productivity was

the single best predictor of a community's extant diversity whereas "snapshot" measures of contemporary volume and productivity are much less useful predictors. I interpret these results in the context of population growth parameters and extinction rates. In chapter 2, I present the results of a field study of natural microbial digestive communities occupying leaves of the carnivorous pitcher plant *Darlingtonia californica*. I combine microscopy, biochemical assays, and community sequencing with respirometry and stable isotope pulse-chase experiments to examine how microbial community succession influences rates of detrital turnover, respiration, and nitrogen cycling in developing micro-ecosystems. I demonstrate that microbial community development and turnover in *D. californica* proceeds in parallel over time with communities becoming more similar to one another. These communities have considerably predictable dynamics such that the bacterial communities from one population can be used to quite accurately predict the ages of pitcher leaves in a different population and year. Furthermore, and in accordance with general successional theory, bacterial communities tended to display unimodal patterns in species diversity over time. This trend appeared driven by differences in the predicted functional properties of bacterial communities. I also encountered unimodal trends in rates of decomposition by the digestive community and nitrogen uptake efficiency by the host leaf. Bacterial diversity and bacterial and midge larvae biomass were positively associated with rates of decomposition, which in turn were positively associated with the efficiency of nitrogen uptake by the host leaf. This study is among the first to demonstrate predictable successional patterns and biodiversity-ecosystem functioning relationships in natural microbial communities. In chapter 3, I present the results of a laboratory experiment demonstrating a decrease in the strength of biodiversity-ecosystem function (BEF) relationships and competitive interactions during succession in *Darlingtonia californica* leaves. It is often assumed that as ecosystems develop, competition-colonization tradeoffs or niche differences favor the gradual establishment of a biota more successful at competing for resources, leading to increased rates of

competitive exclusion and shifting BEF relationships. My approach involved collecting bacterial strains from a cohort of leaves every 11 days over a one-year period and assembling them into communities of varying richness levels such that each community contained either 1, 2, 5, or 10 taxa also isolated from leaves of the same age. By employing an experimental design that allowed for the estimation of individual species' effects as well as their interactions, I show that the relationship between community richness and carbon mineralization rates are most positive during early succession (22-55 days) and gradually decrease over time. Furthermore, diffuse competition was greatest during these same time periods. Together, these results suggest that the effects of species additions or removals on ecosystem processes can vary across time. Chapter 4 presents an experiment testing a long-held assumption regarding the natural history of *Darlingtonia californica*. Specifically, I test the centuries-old assumption that the unique forked 'fishtail appendage' found on leaves of *D. californica* play an important role in the plant's capture of arthropod prey. In a series of field experiments, I manipulated the presence/absence of the appendage on developing pitcher leaves and compared their prey compositions and biomass. I found that the absence of the fishtail appendage does not significantly impact prey capture success at the level of the individual leaf or within an entire population of leaves. Therefore, contrary to widespread beliefs, the fishtail appendage does not appear to be a critical adaptation enabling carnivory in this species. Instead, I propose three alternative scenarios for the evolutionary maintenance of this structure: 1) as a vestigial structure, 2) as a photosynthetic structure and 3) as a structure serving a potentially mutualistic role with the local insect community.

Molecular Biology Feb 27 2021 Molecular Biology: Academic Cell Update provides an introduction to the fundamental concepts of molecular biology and its applications. It deliberately covers a broad range of topics to show that molecular biology is applicable to human medicine and health, as well as veterinary medicine, evolution, agriculture, and other areas. The present Update includes the study guide with online content, journal specific images, and test bank. It also offers vocabulary flashcards and online self-quizzing called Test Prep. The book begins by defining some basic concepts in genetics such as biochemical pathways, phenotypes and genotypes, chromosomes, and alleles. It explains the characteristics of cells and organisms, DNA, RNA, and proteins. It also describes genetic processes such as transcription, recombination and repair, regulation, and mutations. The chapters on viruses and bacteria discuss their life cycle, diversity, reproduction, and gene transfer. Later chapters cover topics such as molecular evolution; the isolation, purification, detection, and hybridization of DNA; basic molecular cloning techniques; proteomics; and processes such as the polymerase chain reaction, DNA sequencing, and gene expression screening. *Now with an online study guide with the most current, relevant research from Cell Press *Full supplements including test bank, powerpoint and online self quizzing *Up to date description of genetic engineering, genomics, and related areas * Basic concepts followed by more detailed, specific applications * Hundreds of color illustrations enhance key topics and concepts * Covers medical, agricultural, and social aspects of

molecular biology * Organized pedagogy includes running glossaries and keynotes (mini-summaries) to hasten comprehension
